2014 Vesicular Stomatitis Outbreak in Colorado and Texas

Angela Pelzel-McCluskey, DVM
Equine Epidemiologist
USDA-APHIS-Veterinary Services
Surveillance, Preparedness, and Response Services
October 2014
Vesicular Stomatitis (VS)

- **Vesicular Stomatitis Virus** – New Jersey or Indiana-1 serotypes in the U.S.
- Mostly affects **horses, cattle, and swine**, but sheep, goats, and camelids (llamas, alpacas) are also susceptible
- **Formation of vesicles**: tongue, lips, around the mouth or nose, on the udder or sheath, or along the coronary bands
- **Vesicles rupture and contain VSV**; no viremic stage in horses or cattle
- **Zoonotic via contact with lesions**
Transmission of VSV

- **Main routes of transmission**
  - **Vectors** – biting flies
    - Black flies
    - Sand flies
    - Culicoides (biting midges)
  - **Direct contact with the ruptured vesicles (lesions) of affected animals**
  - **Contact with areas/objects recently contaminated with virus from lesions**
    - Shared water troughs
    - Feed buckets
    - Other contaminated surfaces
Vesicular Stomatitis

- VSV circulates year-round in southern Mexico; only occasionally moves north (climatic factors that favor vector population)
- Natural movement of infected vectors tends to follow waterways (black fly hatch)
- # infected vectors increases by co-feeding
- Infected flies transmit virus to their eggs
- While up to 70% of the herd on an affected premises will have titers indicative of exposure, only 10% or less of the herd will develop lesions
- Exposed animals maintain titers for years (cELISA and VN)
## Outbreaks of VS in Recent History

VSV 2014 – Texas, Colorado

• As of Oct. 15, 2014 sitrep:
  - Total of 388 VSV-positive premises identified
    - 326 premises in 14 Colorado counties
    - 62 premises in 13 Texas counties
  - 370 equine premises, 16 bovine premises, 2 eq/bov prems
  - 538 infected horses, 32 infected cattle
  - Over 11,600 total susceptible animals quarantined
  - All premises released in TX; 261 premises released in CO

• OIE has officially delisted VSV, although the requirements to report are still in place until Jan. 1, 2015
Weekly VSV Situation Reports, Maps, and disease information available on the USDA-APHIS website

State-specific updates available at the Texas Animal Health Commission and Colorado Department of Agriculture websites

VSV Response

• Passive surveillance by private practitioners
• Quarantine/hold order on suspect premises
• FADD sample collection on lesioned animals only
  – Collect serum, swabs, tissue tags
  – Equine samples to NVSL-Ames; ruminants/pig samples to FADDL
• Zoonotic potential – wear gloves, take care to avoid animals sneezing/coughing in your face
• Premises that meet case definition remain quarantined for 21-days after lesions have healed (covered with new epithelium)
• Re-examine at release date to confirm lesion healing and no new cases, then release
VSV Response

- Education and outreach
  - Recommendations to owners of affected premises on mitigations to reduce within herd spread
  - Information on USDA-APHIS, TAHC, CDA websites
  - News announcements and facebook updates made available by TAHC and CDA

- Research Opportunities
  - Virus isolation from many premises
  - Epidemiology questionnaire administered for premises risk factors
  - CEAH case-control study for horse-level risk factors
VSV After Action

• After Action Reviews planned
  ➢ Evaluate field-level responses in Texas and Colorado
  ➢ Bring issues from field-level AAR to national level AAR
  ➢ National level AAR will include state and federal personnel from historically affected states, NVSL/FADDL, NAHLN laboratories, other stakeholders to provide input on future response to VSV in light of OIE delisting

• USAHA discussions among the states
  ➢ Movement restrictions between states during VSV outbreaks
